- Weight: Ranges from 11 to 19 ounces (300 to 550 grams)

Their size and morphology optimize them for their dual life ? agile swimmers underwater and nimble walkers on land.

Habitat and Distribution

Nesting Sites and Breeding Colonies

Puffins are highly colonial nesters, forming large breeding colonies on rocky islands and cliffs. These sites provide safety from predators and proximity to feeding grounds. They typically excavate burrows or use crevices in rocks to lay their eggs.

Geographical Range

The Atlantic puffin?s primary habitat spans:

- North Atlantic Islands: Iceland, Greenland, Norway, the Faroe Islands, and the British Isles.
- North American Range: Coastal regions of eastern Canada, particularly Newfoundland and Labrador.
- Some puffin species, like the tufted puffin (Fratercula cirrhata), are found along the Pacific coasts of North America, notably Alaska and California.

Habitat Preferences

Puffins favor:

- Cliffside nesting sites with good drainage and minimal human disturbance.
- Proximity to productive fishing grounds for their diet.
- Cold, temperate waters to support their foraging needs.

Diet and Foraging Behavior

Diet Composition

Puffins are primarily piscivorous, feeding on small fish such as:

- Sand eels
- Capelin
- Herring
- Herring larvae
- Sardines
- Anchovies

They may also consume crustaceans and other small marine invertebrates occasionally.

Foraging Strategies

- Puffins are exceptional divers, capable of plunging to depths of up to 60 meters (200 feet).
- They use their wings to propel themselves underwater in pursuit of prey, a behavior reminiscent of penguins.
- Their keen eyesight allows them to spot fish from above the water surface before diving.
- Puffins often carry multiple fish in their beaks, thanks to their specialized jaw structure with spines that hold prey securely.

Feeding Frequency and Chick Provisioning

- Puffins typically make several trips per day to feed their chicks.
- A single trip may involve catching multiple fish to ensure the chick's nutritional needs are met.
- The parent puffins? efficient feeding behavior is vital for chick survival, particularly during the breeding season.

Reproductive Behavior and Life Cycle

Nesting and Breeding

- Puffins usually breed once a year, with the breeding season spanning from late spring to early summer.
- They form monogamous pairs, often returning to the same nesting site with the same mate annually.
- Nesting involves digging burrows or occupying existing crevices, where they lay a single egg.
- Both parents incubate the egg, taking turns over a period of about 36-45 days.

Chick Rearing and Fledging

- After hatching, the chick remains in the nest for approximately 6-8 weeks.
- During this period, the parents continuously feed and guard the chick.
- When ready to fledge, the chick makes its first flight at about 35-50 days old.
- Fledglings are vulnerable and must learn to forage independently in the open ocean.

Longevity and Lifespan

- Puffins have a lifespan of around 20 years in the wild.
- They tend to reach sexual maturity at 3-5 years old.
- Their long lifespan and consistent breeding contribute significantly to their population stability when conditions are favorable.

Migration Patterns and Seasonal Movements

- Puffins are migratory birds, spending the non-breeding season at sea.
- After the breeding season, they head into the open ocean, sometimes traveling thousands of kilometers.
- During migration, they are less visible, but some sightings suggest they can be found as far south as the coast of continental Europe and North America.
